

Declaration on PFAS - Shrink-Kon

Per- and Polyfluoroalkyl substances (PFAS) are a large and complex group of synthetic chemicals substances that have been used in many consumers, commercial and industrial products since 1940.

Based on the information received from our supply chain we can confirm our Shrink-Kon products **do** contain PFAS substances.

Polymetric PFAS (fluoropolymers) used in Shrink-kon products are distinct class of PFAS which have been assessed as polymer of “low concern” by organisation of Economic Co-operation and Development (OECD).

The properties of fluoropolymers are very different to other types of PFAS. They are dimensionally too large to be bio-accumulative and have no known toxicity.

As an organisation we are following up closely for further PFAS updates by European Chemical Agency (ECHA) and any forthcoming requirements or new EU regulations on its use.

Once we receive further updates, we will communicate this back with our customers.
