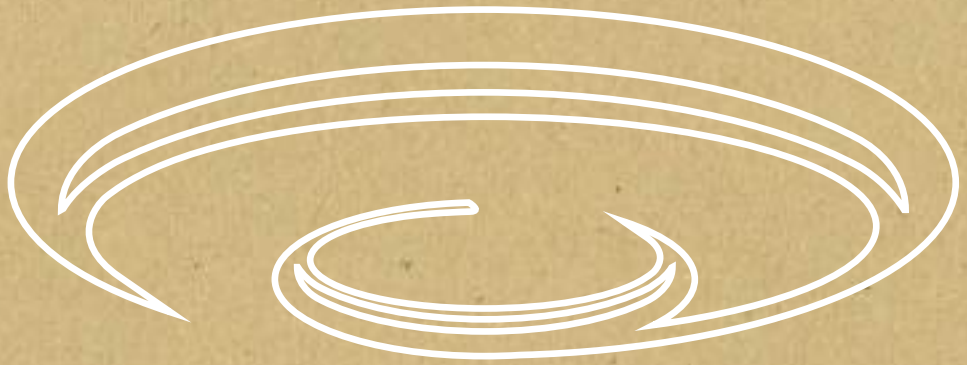
PROFESSIONAL LIGHTING



since 1996

LIGHTING SOLUTIONS 2021

OUR BRAND

Three different quotations were received for a stunning bar. An interior designer stuck to a drawing table, finally realized the perfect colour to put on the walls. Endless discussions were held about the right chairs. The interior of a store, restaurant or hotel has to be on point. The design of the establishment determines atmosphere and appearance. It is part of your brand. But what to do with the lighting? How do you incorporate this into your design, to contribute to perception and atmosphere? Have you ever really thought about this?

At Internova, we plan and design professional LED lighting. Our main focus is in the retail and hospitality industry. As producers of light, we are proud of our broad selection of lighting products. We advise a lighting strategy based on LED modules, lumens, lighting colour and focal points. All our fixtures are made in The Netherlands. During the past 24 years, we have been part of many big hospitality and retail projects. Projects in collaboration with wholesalers and lighting specialists.

Our functional lighting is not only easy on the eye, but is designed with a purpose. Lighting not only has to contribute to the atmosphere, but it is also a part of the branding, routing and conversions. It takes more than just a set of lights and track to make it work. Lighting is a specialty, which makes it a real profession. And therefore; Internova: professional lighting.

PROFESSIONAL LIGHTING since **1996**

INDEX INTERNOVA

made in **HOLLAND**

Utility
That's where you want to work!

The right lighting in a utility environment contributes to the well-being of the employees and creates a pleasant working environment. Our lighting planners can build beautiful 3D lighting concepts according to the latest NEN standards, for the perfect office environment.

Shops
Seductively illuminated!

If the layout of a shop changes, the lighting should always be easy to adjust. That is why Internova tracklights in combination with our flexible Powergear® track system are perfect to use in any shop. Understand the art of seduction by creating a great product presentation using Internova's FASHION spots!

Restaurant & Bar
Make things happen!

In restaurants and bars, good lighting is not only important to create the perfect atmosphere, but must also be functional. By using the right combination of functional and decorative lighting a space can be brought to life.

Showroom
Don't be that simple!

Light creates atmosphere, branding, conversion and routing. Good showroom lighting does not consist of a simple combination of spots and tracks. For the right lighting, a well-thought-out lighting plan is essential. Internova designs and realizes customized (3D)lighting plans.

Supermarket
The volume can be increased!

A common mistake is the use of flat line lighting in a supermarket, which means that there is no atmosphere and a bad appearance. By creating the perfect balance between general lighting and spot lighting, our lighting designers can provide the right atmosphere. Also consider applying special lighting for fresh food and cosmetics! This makes a visit to these stores a pleasant experience which contributes to the increase of sales volumes.

Fresh Food
That tastes like more, doesn't it?!

Where other LED food modules can cause food to perish (e.g. aging of fresh meat and fish) within a few hours, the Premium Food LED modules by Internova are suitable for lighting fresh food products without any issues. This is achieved by selecting the correct wavelength combinations within the LED chips, the correct amount of light is also very important. The fresh food is displayed in the best possible way: true-to-life colours and a tasteful look.

LIGHTING DEFINITIONS

In our product descriptions you will find a number of typical lighting definitions and symbols. We have summarized some of the most commonly used product features in accessible descriptions.

LUMEN - *Output of luminous flux*

The amount of light output generated by a lightsource. The higher the lumen output, the higher the amount of light.

CRI Ra - *Colour rendering index*

Indicates on a scale 0-100 how natural a light source can render true colours of illuminated objects and spaces. Natural daylight has a CRI of 100Ra.

CCT - *Collerated Colour Temperature*

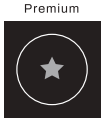
CCT is measured in degrees Kelvin (K) and indicates the colour appearance of the light source. Artificial light is mostly rated between 2200K and 5700K. The higher the temperature, the cooler the light.

UGR - *Unified Glare Rating*

The UGR is the index that quantifies the discomfort glare. UGR is rated between 10 and 28 whereby 10 is very comfortable. Office lighting should always be lower than 19 (UGR <19)

LED MODULES

Basic lighting module available in CRI >80Ra and >90Ra in 2700K, 3000K, 4000K, and 5700K



Excellent quality of light and colour rendition, combined with high energy efficiency. Ideal for creating ambience, fresh whites and depth of colour in many retail environments. Premium White module available in CRI >80Ra and >90Ra in 3000K and 4000K. Premium Ambiance module available in CRI >90Ra in 2200K.

LED modules dedicated towards fresh food applications. Food WarmWhite Module: Enhances the appearance of fresh food, such as bread, fruit and vegetables. Food Premium Meat Module: Enhances the appearance of fresh meat. Fresh Fish Module: Enhances the appearance of fresh fish.

Dim-to-Warm is a technology that reduces a luminaire's colour temperature when being (phase) dimmed, from 3000K to 2200K. This makes our Dim-to-Warm fixtures ideal to use in domestic and hospitality projects.

Tunable White allows you to control the colour temperature of a fixture between 2500K and 7000K. Our Tunable White fixtures can be controlled using the user friendly Casambi app.

OPTIONS

TRIAC - A switch that is used to control power by phase cutting. When used in lighting applications, it's commonly referred to as Triac dimming.

DALI - Protocol of controlling the luminaire whereby a data signal can control each driver individually.

1-10V - the driver generates an analogue signal of 1V (minimum) to 10V maximum, which reaches the dimmer switch (potentiometer) which modulates it.
